

RECONFIGURATION OF A NETWORK BY UTILIZING
A PREDETERMINED LENGTH QUIESCENT STATE

Abstract Of The Disclosure

5 A network having a plurality of nodes is reconfigured to
reflect a change in topology of the network. In particular, upon
receiving a reconfiguration request, each node enters a quiescent
state for a predetermined period of time sufficient to allow at
least one other node to also enter a quiescent state. Then, upon
10 termination of the quiescent state, the node is reconfigured to
reflect the change in the topology of the network without having
to check with any other nodes of the network. In other
embodiments, the predetermined period of time is sufficient to
allow currently executing protocols to complete execution as well
15 as to allow the transmission of reconfiguration requests for
propagating reconfiguration in the network.
